CONSISTENCY WITH THE OBJECTIVES OF THE PNRR

The profound coherence between the project entitled "Digital Transition and Evolution of the Liberal Professions: Computerised Data Processing by Professional Associations" and the objectives of the NRP is evident from the circumstance that the digital transition has long required an unavoidable change in the approach of professional associations to this phenomenon, in view of the problems connected with the computerised management of personal data, both sensitive and non-sensitive, transmitted to them by their members. Starting from this assumption - and in the awareness that the careless handling of certain personal data could cause negative repercussions not only in the personal sphere, but also in the professional sphere of the holder - the project, based on the analysis of the legal impact that the digital transition has on the collection and use, by a Professional Order, of the personal data of its members, as well as the study, on the one hand, of the applicable national and Community legislation and, on the other hand, of the case law that has emerged, the project aims at outlining data management policies by means of digital systems that will secure the information pertaining to the personal sphere of the professional, with a view to preventing unjustified infringements of his/her privacy.

With regard to the second project entitled "Anti-Money Laundering, Computerisation and Consumer Protection in the Liberal Professions", the consistency of the subject under investigation with theobjectives of the NRPR is evidenced by the primary role that the digital transition takes on with reference to the financial transactions carried out by professional Associations, enabling the use of tools suitable for the correct identification and cataloguing of such transactions, which will make it possible to detect any criticalities in the area of anti-money laundering. With this in mind, the project aims to analyse the impact that the digital transition entails with regard to the organisation and use of data on the financial transactions of which a Professional Order is the owner, with specific reference to the cost/benefit ratio that a modern management of the digital transition may entail.
